

# Lecture 10: Hierarchical Agglomerative Clustering

## Introduction to Machine Learning

Sophie Robert

L3 MIASHS — Semestre 2

2022-2023

- 1 Introduction
- 2 Cluster linkage criteria
- 3 Agglomerative clustering
- 4 Dendograms and interpretation
- 5 Number of cluster selection
- 6 Advantages and limits

# Definition: hierarchical clustering

## Lecture 10: Hierarchical Agglomerative Clustering

Sophie Robert

### Introduction

Cluster linkage  
criteria

Agglomerative  
clustering

Dendograms  
and  
interpretation

Number of  
cluster  
selection

Advantages  
and limits

## Hierarchical clustering

Hierarchical clustering\* is a clustering method that seeks to **build a hierarchy of clusters** (clusters within clusters).

# Definition: hierarchical clustering

## Hierarchical clustering

Hierarchical clustering\* is a clustering method that seeks to **build a hierarchy of clusters** (clusters within clusters).

Two approaches:

- **Bottom-up approach (agglomerative\*)**: Each observation starts in its own cluster, and **pairs of clusters are merged as one moves up the hierarchy**. We need to decide when to **merge** clusters.

# Definition: hierarchical clustering

## Hierarchical clustering

Hierarchical clustering\* is a clustering method that seeks to **build a hierarchy of clusters** (clusters within clusters).

Two approaches:

- **Bottom-up approach (agglomerative\*)**: Each observation starts in its own cluster, and **pairs of clusters are merged as one moves up the hierarchy**. We need to decide when to **merge** clusters.
- **Top-down approach (divisive\*)**: All observations start in one cluster, and **splits are performed recursively as one moves down the hierarchy**. We need to decide when to **split** clusters.

# Cluster linkage

## Lecture 10: Hierarchical Agglomerative Clustering

Sophie Robert

### Introduction

Cluster linkage  
criteria

Agglomerative  
clustering

Dendograms  
and  
interpretation

Number of  
cluster  
selection

Advantages  
and limits

To decide when to combine (agglomerative) or when to split (divisive), we need:

# Cluster linkage

## Lecture 10: Hierarchical Agglomerative Clustering

Sophie Robert

### Introduction

Cluster linkage  
criteria

Agglomerative  
clustering

Dendograms  
and  
interpretation

Number of  
cluster  
selection

Advantages  
and limits

To decide when to combine (agglomerative) or when to split (divisive), we need:

- A measure of dissimilarity between *observations*

# Cluster linkage

## Lecture 10: Hierarchical Agglomerative Clustering

Sophie Robert

### Introduction

Cluster linkage  
criteria

Agglomerative  
clustering

Dendograms  
and  
interpretation

Number of  
cluster  
selection

Advantages  
and limits

To decide when to combine (agglomerative) or when to split (divisive), we need:

- A measure of dissimilarity between *observations*
- A measure of dissimilarity between *sets* of observations.

# Cluster linkage

Introduction

Cluster linkage  
criteria

Agglomerative  
clustering

Dendograms  
and  
interpretation

Number of  
cluster  
selection

Advantages  
and limits

## Linkage criterion

A **linkage criterion**\* is a function of the pairwise distances of observations to measure dissimilarity of sets.

Among the most popular,

- 1 Ward
- 2 Complete
- 3 Average
- 4 Single

# Cluster linkage: Ward

Lecture 10:  
Hierarchical  
Agglomerative  
Clustering

Sophie Robert

Introduction

Cluster linkage  
criteria

Agglomerative  
clustering

Dendograms  
and  
interpretation

Number of  
cluster  
selection

Advantages  
and limits

## Ward linkage

The **Ward linkage criterion** minimizes the sum of squared differences within all clusters: it measures how much variance is added to the clustering algorithm if the clusters were to be merged.

# Cluster linkage: Ward

Lecture 10:  
Hierarchical  
Agglomerative  
Clustering

Introduction

Cluster linkage  
criteria

Agglomerative  
clustering

Dendograms  
and  
interpretation

Number of  
cluster  
selection

Advantages  
and limits

## Ward linkage

The **Ward linkage criterion** minimizes the sum of squared differences within all clusters: it measures how much variance is added to the clustering algorithm if the clusters were to be merged.

$$\begin{aligned} W(A, B) &= \sum_{x \in A \cup B} \|x - \mu_{A \cup B}\|^2 - \sum_{x \in A} \|x - \mu_A\|^2 - \sum_{x \in B} \|x - \mu_B\|^2 \\ &= \frac{|A| \times |B|}{|A \cup B|} \|\mu_A - \mu_B\|^2 \end{aligned}$$

# Cluster linkage: Complete

Agglomerative  
Clustering

Sophie Robert

Introduction

Cluster linkage  
criteria

Agglomerative  
clustering

Dendograms  
and  
interpretation

Number of  
cluster  
selection

Advantages  
and limits

## Complete linkage

The **complete linkage criterion** minimizes the maximum distance between observations of pairs of clusters.

Given a dissimilarity  $d$  and two sets  $A$  and  $B$ ,

$$C(A, B) = \max_{A \in A, b \in B} d(a, b)$$

# Cluster linkage: Single

## Lecture 10: Hierarchical Agglomerative Clustering

Sophie Robert

Introduction

Cluster linkage  
criteria

Agglomerative  
clustering

Dendograms  
and  
interpretation

Number of  
cluster  
selection

Advantages  
and limits

## Single linkage

The **single linkage criterion** minimizes the distance between the closest observations of pairs of clusters.

# Cluster linkage: Single

## Question

Compute the linkage criterion of *ward*, *complete*, *average*, *single* between the following sets of  $\mathbb{R}^2$  vectors using *Manhattan distance*:

■  $A = \{[1, 2], [2, 3], [4, 5]\}$

■  $B = \{[3, 1], [4, 5], [1, 5]\}$

selection

Advantages  
and limits

### Question

Using single linkage criterion and manhattan distance, perform Hierarchical Agglomerative Clustering on the following dataset. Test different cut-off values for final clusters.

Sepal length	Sepal width	Petal length
5	2	1
4	3	1
6	5	4
7	1	5

# Dendrograms
