## Question

Can anyone remind me of the definition of supervised learning ?  
Can anyone give me some kind of problems that can be solved with supervised learning ?

and limits

## K-nearest neighbors algorithm

The k-nearest neighbors algorithm is a **non-parametric supervised learning** method, which assigns to an incoming record the label issued from the plurality of votes of its k nearest neighbors.

With an incoming data record:

- Find the  $k \in \mathbb{N}$  nearest neighbors
- Assign the classification label of the most frequent labels among neighbors

# Example

Lecture 5:  
K-nearest  
neighbors

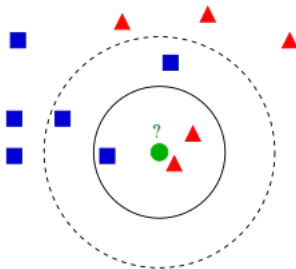

Sophie Robert

Principles

Example

Hyperparameters

Advantages  
and limits

Can you identify a problem with certain values of  $k$ ?

# Example: Dog breed prediction

Lecture 5:  
K-nearest  
neighbors

Sophie Robert

Principles

Example

Hyperparameters

Advantages  
and limits

## Training dataset:

Height	Weight	Label
45	30	Labradoodle
30	25	Labradoodle
40	35	Labradoodle
20	15	English cocker
22	18	English cocker
25	20	English cocker

## Individual to classify using 1 NN and 3 NN (euclidean distance)

Height	Weight	Label
25	31	?

# Example: solution

Lecture 5:  
K-nearest  
neighbors

Sophie Robert

Principles

Example

Hyperparameters

Advantages  
and limits

Compute distance between dataset and individual to classify:

Distance	Label
20.02	Labradoodle
7.81	Labradoodle
15.52	Labradoodle
16.76	English cocker
13.34	English cocker
11.0	English cocker

**Using 1NN:** *Labradoodle*

**Using 3NN:** *English cocker*

# Hyperparameters

Advantages  
and limits

## Hyperparameters

What **hyperparameters\*** does the k-nearest neighbor algorithm require ?

# Hyperparameter selection

Lecture 5:  
K-nearest  
neighbors

Sophie Robert

Principles

Example

Hyperparameter

Advantages  
and limits

To select the optimum hyperparameters (distance to use, best number of neighbors), use **k-fold validation** and select the combination with the highest score (in its simplest version using a factorial design).

# Advantages and limits

Lecture 5:  
K-nearest  
neighbors

Sophie Robert

Principles

Example

Hyperparameters

Advantages  
and limits

## Advantages:

- Very easy to extend to multi-class classification
- Very easy to understand
- Non-parametric algorithm (no assumption regarding data distribution)
- No previous training

## Limits:

- Very sensitive to its hyperparametrization
- Very sensitive to noise (features with little to no impact on the dataset)
- Expensive to compute
